Seed Dispersal

Seeds need to be scattered (dispersed) to ensure the plants or trees have a good chance of finding the correct conditions to grow.

As you walk around the cemetery, can you find any evidence for seed dispersal? Seeds can be dispersed by the wind, by being eaten by animals and then coming out in their poo or by sticking to an animals fur, or insects wing and being carried around.

Try and find some examples of seed dispersal. Write what you found and how you think the seeds could be dispersed here:

Type of plant/tree	How dispersed?

Look out for:

- Holly
- Dandelions
- Poppies
- Sycamore Trees
